Introduction

This guide provides instructions for configuring your Wireless Gateway. The software’s Graphical User Interface (GUI) gives you access to settings that were configured at the factory or by Cox Business for the most common installation configurations. After you access the GUI, you can customize these settings to meet your needs.

Important: If you are not familiar with the network configuration procedures described in this guide, contact your information technology professional before you change any of the settings.

Cisco 3829AD Gateway Overview

The Cox Business Internet Gateway and Guest WiFi service is based on the Cisco Wireless Gateway Model DPC3829AD. It is a high-performance gateway that combines a cable modem, router, and wireless access point(s) in a single device that provides a cost-effective networking solution for small to medium businesses.

The gateway incorporates (8) bonded downstream channels along with four (4) bonded upstream channels. These bonded channels can deliver downstream data rates in excess of 400 Mbps and upstream data rates in excess of 120 Mbps. It provides up to eight (8) times faster download speeds than conventional single-channel DOCSIS® 2.0 cable modems.

- The gateway supports up to 50 simultaneous users for the 2.4 GHz and another 50 simultaneous users for the 5.0 GHz radio for a total of 100 simultaneous users if both radios are fully utilized. WiFi distance recommendations - 10,000 square feet for the 2.4 GHz radio and 7,500 square feet for the 5.0 GHz radio.

**Note:** All environments are different and impacted by several real world factors such as steel walls, microwaves, and other RF interference

The gateway also offers:

- Dual band simultaneous 2.4Ghz and 5.0Ghz radios with 3x3 MIMO high power antennas that deliver 802.11ac with beamforming technology (up to 50 users per radio)
- 4 Gigabit Ethernet ports
- Stateful Packet Inspection firewall technology
- Static IP addressing (IPV4 and IPV6)
- VPN point-to-point and pass-through

The integrated router features a Dynamic Host Configuration Protocol (DHCP) server, Network Address Translation (NAT), Network Address Port Translation (NAPT), and a Stateful Packet Inspection (SPI) firewall. These features allow you to share a single high-speed public Internet connection and files between devices in the network by attaching multiple wired/wireless devices to the wireless business gateway.
Cox Business Internet Gateway and Guest WiFi Services

The Cisco 3829AD Gateway delivers two distinct services; Internet Gateway and Guest WiFi. Customers who purchase both services have two physical gateways deployed in their business location.

**Internet Gateway Service**

Internet Gateway service is delivered via a Cisco 3829AD Gateway to provide both wired and wireless networks. The customer administrator has full access to the gateway to configure up to 16 wireless networks and other available feature sets as described in this administrators guide. All networks share bandwidth and priority of IP traffic to and from the various networks and are equal. Customers may choose from any Cox Business Internet Access speed tiers available in their market.

**Guest WiFi Service**

A second gateway, second HFC drop, and a guest WiFi option provide dedicated bandwidth to customers so that their business’s internet access is not impacted by WiFi users.

This type of configuration ensures that Guest WiFi traffic, such as Netflix or gaming in the waiting room/lobby, does not impact the core business internet needs. The Guest WiFi gateway may also be useful when the geographic location of the Internet gateway and intended Guest WiFi area are far enough apart that a single WiFi access point can’t cover both locations.

The customer has three speed tier options to accommodate anticipated peak simultaneous users on the dedicated the Guest WiFi network. The options include:

- Basic Guest WiFi (5Mbps x 1)
- Plus Guest WiFi (15 x 3)
- Premium Guest WiFi (28 x 4)

Customers must purchase CBI (Cox Business Internet) to add the Guest WiFi service. Guest WiFi is delivered via a second cable modem/gateway. The Guest WiFi gateway can have one (1) SSID per radio enabled. Many of the other Internet gateway features are removed from the admin interface because this device is dedicated to Guest WiFi users only, and advanced features are rarely needed.

The Guest WiFi is unmanaged by Cox. This means the device WiFi Capabilities are not actively monitored for uptime or security events by Cox. Cox does not provide support or configuration for WiFi end points (PC, MAC, Android, iOS, etc.) The customer admin determines if the WiFi network is password-protected or open.

Cox is not responsible for customer impacting network or security issues.
Log in to the Gateway{ XE "Logging in to the Gateway" } t "See" }

This section provides instructions for logging in to the Wireless Business Gateway so that you can customize the gateway to suit your needs rather than using the default (factory) settings.

**Note:** It is strongly recommended that you use an Ethernet connection versus Wi-Fi when you first connect to the gateway. If you use Wi-Fi during initial configuration and you alter the Service Set Identifier (SSID), you will be dropped from the network when the change is submitted. You will then have to reconnect using the new SSID.

The same recommendation applies to changing the wireless passphrase. It is best to make these changes over an Ethernet hard-wired connection.

The gateway uses a default IP address of 192.168.0.1. If you have connected to the gateway correctly and configured your computer properly, use the following procedures to log in to the gateway as an administrator.

**Figure 1. Login screen**

1. Open your web browser and enter the following IP address: 192.168.0.1.
2. Press the **Enter** key.
   
   **Result:** The Status DOCSIS WAN login page displays.
3. Enter your **User Name** and **Password** and click the **Log In** button.
4. By default the username and password fields are both empty. After initial login the admin may create a new username and password. It is highly recommended that customers update the username and password and not leave blank.
Change Your Username

The Cisco application allows you to change your name when needed.

Figure 2. Change Username screen

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Password</td>
<td></td>
</tr>
<tr>
<td>User Name:</td>
<td>Displays the user name for the operator currently logged in to the gateway.</td>
</tr>
<tr>
<td>Change Password to:</td>
<td>Allows you to change your password.</td>
</tr>
<tr>
<td>Re-Enter New password:</td>
<td>Allows you to re-enter the new password. You must enter the same password as the one entered in the Change Password to: field.</td>
</tr>
</tbody>
</table>

Use the following steps to change your username.

1. Log in to the application and click the Log In button.
2. Click the Administration menu option in the toolbar and click the Management tab.
3. Scroll to the Gateway Access / Local Access section and change your user name and your password and then click the Save Settings button at the bottom of the screen.
Set Up Basics \{ XE "Set Up Basic Functionality" \t "See" \}

This section instructs you on how to configure basic functionality for your gateway settings.

**Quick Setup Tab**

Use the **Quick Setup** page to change your password and to configure the WLAN.

**Important:** The settings on this page are unique to your gateway. You may elect to modify the setting values or keep the default values. These default settings are all that you need to operate a secure wireless network. We recommend that you keep your gateway in a physically secure location away from malicious users who might attempt to factory reset your gateway.

**Changing Your Password**

**Important:** We recommend that you create a new password regularly to protect against Internet attacks that specifically search for devices operating with well-known or factory default user names and/or passwords.

![Change Password screen](image)

**Figure 3. Change Password screen**

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Password</td>
<td><strong>Change Password to:</strong> Allows you to change your password.</td>
</tr>
<tr>
<td></td>
<td><strong>Re-Enter New password:</strong> Allows you to re-enter the new password. You must enter the same password as the one entered in the <strong>Change Password to</strong> field.</td>
</tr>
</tbody>
</table>

Use the following steps when you want to change your password only.

1. Log in to the system and click the **Setup** menu in the toolbar.
2. Click the **Quick Setup** tab.
3. Enter your new password in the both the **Change Password to:** field and the **Re-enter New Password** field.
4. Click the **Save Settings** button at the bottom of the screen.
Configure Wi-Fi Network

The next two sections on the Quick Setup tab include how to configure the primary network for the Wi-Fi Radio 1 and Wi-Fi Radio 2.

Figure 4. Wi-Fi Network Configuration

The following table describes what each field means.

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Radio 1 Network and Wi-Fi Radio 2 Network</td>
<td>802.11 Band: Allows you to choose which Wi-Fi band you are configuring. Wireless Interface: Allows you to Enable or Disable the wireless network. Network Name (SSID): Allows you to enter a name for your wireless network or to use the default value. The value you enter will be viewable on PCs and other wireless client devices. Note: The factory default Service Set Identifier (SSID) is either the last six (6) characters of the CM MAC Address or the SSID as identified on the product label.</td>
</tr>
</tbody>
</table>
Use the following steps to configure the **Wi-Fi Radio 1 (2.4GHz)** and **2 (5.0GHz)** Networks.

1. Log in to the system and click the **Setup** menu in the toolbar.

2. Click the **Quick Setup** tab.

3. Scroll to the **Wi-Fi Radio 1 Network** section and use the information in the **Field Description** column in the table above to help you populate the fields.

4. Repeat step 3 for the **Wi-Fi Radio 2 Network** section.
   a. Note that the SSID network names can be configured the same for each radio. Most devices (phones, tablets and computer) will auto select the best available network based upon the hardware capabilities of the device. If the admin wants users to be aware of the network capabilities the SSIDs could be labeled to include 2.4 or 5.0 as an example.

5. Click the **Save Settings** button.
**Configure LAN Setup**

The LAN Setup page allows you to configure the settings for the Local Area Network (LAN). These settings include the range of IP addresses that define the LAN itself, as well as how the addresses are assigned (automatically by DHCP or manually) as new devices are added to the network.

**Configure Gateway IP**

*Important:* Unless you are knowledgeable about administering IP addresses, we recommend that you do not change these settings. If you change these values incorrectly, you can lose Internet access.

**Figure 5. Configure LAN Gateway IP screen**

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Setup (LAN) Gateway IP</td>
<td><strong>Local IP Address.</strong> The base IP address of the private LAN. The factory default LAN IP Address is 192.168.0.1</td>
</tr>
<tr>
<td></td>
<td><strong>Subnet Mask.</strong> The subnet mask for your LAN.</td>
</tr>
</tbody>
</table>

Follow these instructions to apply settings to the **Configure LAN Setup / Gateway IP**:

1. The Setup LAN page appears whenever you log on to the gateway. However, if the page does not display, click the LAN Setup tab and scroll to the Network Setup (LAN) Gateway IP section.

2. Use the information in the Field Description column in the table above to help you populate the fields.

3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure Network Address Server Settings

**Figure 6. Network Address Server Settings**

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Address Server Settings (DHCP)</td>
<td><strong>DHCP Server.</strong> Allows you to enable or disable the DHCP server in the business gateway. The DHCP server is used to automatically allocate IP addresses to devices as they are attached to your network.</td>
</tr>
<tr>
<td></td>
<td><strong>Connected Devices Summary.</strong> Displays the MAC Address and IP Address of the devices that are connected to the gateway.</td>
</tr>
<tr>
<td></td>
<td><strong>Pre-assigned DHCP IP Addresses.</strong> Click Pre-assigned DHCP IP Addresses to assign a specific IP address to a PC or other device when they request an IP address using DHCP. Only addresses within the range of the gateway’s DHCP address pool can be reserved with this feature.</td>
</tr>
<tr>
<td>Section</td>
<td>Field Description</td>
</tr>
<tr>
<td>---------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| Network Address Server Settings (DHCP) (continued) | Notes:  
The Add Static IP button adds the Static IP address to the list of factory assigned IP addresses.  
The Remove Static IP button removes the Static IP address from the list of assigned IP addresses  
Starting IP Address: Displays the starting address used by the built-in DHCP server to distribute Private LAN IP addresses. Because the device default IP address is 192.168.0.1, the starting IP address must be 192.168.0.2 or greater, but smaller than 192.168.0.253.  
Maximum Number of DHCP Users: Enter the maximum number of users to which the DHCP server can assign IP addresses for use in the LAN. This number cannot be greater than 254 minus the starting IP address described above.  
Client Lease Time: The amount of time an IP address is valid. IP address leases are renewed automatically by your PC and other devices that use DHCP to obtain IP addresses. If a lease is allowed to expire, the IP address will be returned to the pool of available IP addresses that can be assigned by the DHCP server as new devices are added to your network. The default is 60 minutes when the gateway is online.  
LAN Static DNS (Domain Name Server) 1-3: DNS is used by a PC or other client devices to locate the public IP address associated with a URL or the name-based address of a website. You can manually specify which DNS servers are to be used by devices in your network by entering the servers' IP addresses. Otherwise, the gateway will forward the DNS server information from the Cox Business Internet service automatically. The default is to leave these fields blank.  

Use the following steps to configure the Network Address Server (DHCP):  
1. Log in to the system and click the Setup menu in the toolbar and the LAN Setup tab.  
2. Use the information in the Field Description column in the table above to help you populate the fields.  
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure Time Settings

The last section of the Quick Setup tab allows you to set up the correct time zone for the server in your location.

**Figure 7. Time Settings screen**

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Settings</td>
<td><strong>Time Zone</strong>: Select the time zone for your location. If your location follows daylight saving time, select <strong>Automatically adjust clock for daylight saving time</strong>. Provide input/verify descriptions for the following settings: <strong>Daylight Saving time &lt;X&gt; minutes</strong> <strong>Time Server</strong>: Enter the name of a server to be used as the Daylight Saving Time (DST) server and click <strong>Add Server</strong> to add the server. <strong>Remove Server</strong>: To eliminate a server from the list of available DST servers, select the server and click <strong>Remove Server</strong>. <strong>NTP</strong>: Select <strong>Enable</strong> or <strong>Disable</strong> to indicate whether or not a Network Time Protocol (NTP) server will be used.</td>
</tr>
</tbody>
</table>

Use the following steps to configure Time Settings.

1. Log in to the system and click the **Setup** menu in the toolbar and the **LAN Setup** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. When you are done, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.
Configure DDNS Settings  

Dynamic Domain Name Service (DDNS) provides the gateway—for which the IP address can change—with a host name or URL that can be deciphered by network applications through standard DNS queries. DDNS is useful when you host your own website, FTP server, or other server behind the device.

**Note:** You must sign up for DDNS service before you can use this feature.

This section describes how to perform the following from the DDNS Setup page:

- Disable DDNS
- Enable and configure DDNS

Figure 8. Configure DDNS screen

Enable and Configure DDNS  

To use the DDNS feature, you must first set up an account and establish a URL with www.DynDNS.org. The DNS feature will not work without a valid account.

Follow the instructions on the website to set up an account. After you have set up a valid account for DDNS, use the steps below to configure the gateway for DDNS service.

1. From the Setup page, click the DDNS tab.
2. Click the drop-down arrow and select Enable.
3. Enter your User Name, Password, and the name of the Host in the corresponding fields.
4. Click the Save Settings button to save your changes.

**Result:** The gateway advises the DDNS service of your current WAN (Internet) IP address whenever this address changes. **(Note:** The Status area of the window displays the status of the DDNS service connection.)
Disable DDNS

Follow these instructions to disable DDNS (the factory default setting):

1. From the Setup page, click the DDNS tab.
   Result: The DDNS opens and displays available settings.

2. Click the DDNS Service drop-down list and select Disable.

3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure Wireless Settings

Setting up the gateway for wireless communication allows you to connect to the Internet from any location within range of the wireless application protocol (WAP) without having to use wired connections.

This section provides procedures for configuring the WAP to meet your needs. These options are available as tabs on the Wireless.

Configure WPS

Use this page to configure Wi-Fi Protected Setup (WPS) to attach WPS-enabled devices to your network. When you select WPS as your wireless configuration, settings are pre-configured.

Figure 9. Wireless WPS screen
Configure Wireless Settings

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Wi-Fi Protected Setup</td>
<td><strong>Enable / Disable.</strong> Select the radio button to activate or deactivate wireless protection for your gateway. Click the <strong>Wi-Fi Protected Setup</strong> icon on the client side at the same time you press the Wi-Fi Protected Setup button on the device to automatically establish protection. <strong>Wi-Fi Protected Setup PIN.</strong> This is the most secure option to register a wireless client with the gateway. The Wi-Fi Protected Setup PIN number is found in the client Wi-Fi Protected Setup utility. After entering the client's Wi-Fi Protected Setup PIN number, you can connect to the gateway by clicking the <strong>Register</strong> button. <strong>WPS Setup Using the Gateway PIN.</strong> Note the gateway's Wi-Fi Protected Setup PIN number that is displayed on the Wi-Fi Protected Setup page. Click the <strong>Register</strong> button (using any Wi-Fi Protected Setup client utility) and enter the gateway's Wi-Fi Protected Setup PIN number in the client device to complete the registration. To create a new gateway PIN number for use in pairing with a WPS client, click <strong>New PIN Code</strong> and a number will be randomly generated.</td>
</tr>
<tr>
<td>Wi-Fi Radio 1 Network</td>
<td>Displays the name of the network and the security level chosen for the Radio 1 network.</td>
</tr>
<tr>
<td>Wi-Fi Radio 2 Network</td>
<td>Displays the name of the network and the security level chosen for the Radio 2 network.</td>
</tr>
</tbody>
</table>

Use the following steps to enable or disable the Wi-Fi Protected Setup.

1. From the **Wireless** menu in the toolbar, click the **WPS** tab.
2. Scroll to the **Wi-Fi Protected Setup** section and select the **Enable** radio button if you want to use WPS to set up devices that support WPS. Otherwise, select the **Disable** radio button.
3. Use the information in the **Field Description** column in the table above to help you populate the fields.
4. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.

**Note:** When using WPS mode, wired equivalent privacy (WEP) is not supported. If you must use WEP encryption, select the **Disabled** button. Cox strongly advises against using WEP because it is a compromised WiFi security method and can easily be hacked.
Configure Radio Settings{ XE "Radio Settings" \t "See" }

This section describes how to configure the interface on the Wi-Fi Networks for both Radio 1 and Radio 2.

</table>

Follow these instructions to configure Wireless Security settings:

1. From the **Wireless** menu in the toolbar, click the **Wireless Security** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.
Configure Guest Network Settings

The Guest Networks tab is only available in the Cox Business “Internet Gateway” subscription and gateway configuration. This feature is different from the Cox Business Guest Wi-Fi service offering because it allows you to define guest Wi-Fi SSIDs for each radio, even though the Internet service bandwidth tier is shared between all enabled guest Wi-Fi SSIDs. The Guest Network tab allows you to configure up to seven (7) additional SSIDs per radio. Remember that these SSIDs share the same Internet bandwidth.

When you subscribe to the Cox Business Guest Wi-Fi service, bandwidth and a second physical gateway is dedicated for guest Wi-Fi users and there is no contingency to the primary gateway’s bandwidth. The second gateway dedicated to “Guest WiFi” network will not have access to the Guest Network tab in the GUI.

The “Guest Network” section allows you to set up the Wi-Fi Radio Guest Network for both Radio 1 and Radio 2, which includes naming the network and designating whether you want to enable it as a SSID Broadcast. In the Guest Network Settings section, you provide technical specifications for the DHCP server. When creating additional SSIDs in the “Guest Network” tab, all networks on the gateway share the Internet access bandwidth. There is no priority given to any SSID.

<tr>
<td>Wi-Fi Radio Guest Network</td>
<td><strong>Wireless Interface.</strong> Allows you to select the wireless interface that you want to configure. The options are Radio 1 and Radio 2.&lt;br&gt;<strong>Network Name (SSID)</strong> The name that you want to assign to the Service Set Identifier (SSID).&lt;br&gt;<strong>MAC Address (BSSID)</strong>. Similar to the SSID, the Basic Service Set Identifier (BSSID) is the 'name' of the wireless network that shows up under network connections.&lt;br&gt;<strong>SSID Broadcast.</strong> An SSID is the name of a wireless local area network (WLAN). All wireless devices on a WLAN must use the same SSID in order to communicate with each other. The SSID on wireless clients can be set manually, by entering the SSID into the client network settings or automatically, by leaving the SSID unspecified or blank. A network administrator often uses a public SSID that is set on the access point and broadcast to all wireless devices in range. Some wireless access points disable the automatic SSID broadcast feature to improve network security. By disabling the broadcasting of the SSID, or even the beacon signal itself, you can hide the presence of your wireless network or at least obscure the SSID itself which is critical for a device to connect to your network.&lt;br&gt;<strong>Enable.</strong> Check this box to allow the SSID broadcast.</td>
</tr>
<tr>

<tr>
<td>-----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Guest Network Settings</td>
<td><strong>Network Name (SSID)</strong>. The name of the network that you want to configure &lt;br&gt;<strong>Security Mode</strong>. Select the level of security that you want to apply to the network that you selected from the Network Name (SSID) drop-down list. &lt;br&gt;<strong>Wired Equivalent Privacy (WEP)</strong> is a security protocol for wireless networks that encrypts transmitted data. Without any security your data can be intercepted without difficulty. <strong>Note</strong>: WEP is a well known compromised security and should not be used. WEP has three settings: Off (no security), 64-bit (weak security), 128-bit (a bit better security). WEP is not difficult to crack, and using it reduces performance slightly. If you run a network with only the default security, where WEP is turned off, others can immediately log on to your network and use your Internet connection. &lt;br&gt;<strong>Wi-Fi Protected Access (WPA)</strong> replaces WEP with a protocol that is — given current technology — impossible to crack. &lt;br&gt;<strong>DHCP Server</strong>. Dynamic Host Configuration Protocol (DHCP) is a networking protocol that is used by servers on an IP network to allocate IP addresses to computers. The purpose of DHCP is to automate the IP address configuration of a computer without a network administrator. &lt;br&gt;<strong>IP Address</strong>. An IP address is assigned to a computer for a set interval, after which, the computer must renew the IP address or acquire a new one. In this field, enter the IP address of the DHCP server. &lt;br&gt;<strong>Subnet Mask</strong>. A mask is used to determine what subnet an IP address belongs to. An IP address has two components, the network address and the host address. For example, the first two numbers (150.215) in the IP address 150.215.017.009 represent the network address, and the second two numbers (017.009) identify a particular host on this network. Subnetting enables the network administrator to further divide the host part of the address into two or more subnets. &lt;br&gt;<strong>Lease Pool Start</strong>. The first IP address in the scope of addresses that you will use for the DHCP server. After a DHCP scope is established changes in the number of nodes that require DHCP leases may change over time. &lt;br&gt;<strong>Lease Pool End</strong>. The last IP address in the pool of addresses that you use for the DHCP server. a certain address pool and determine that the address pool range needs to be increased, you can simply delete the scope and recreate it. Deletion of the scope will. &lt;br&gt;<strong>Lease Time</strong>. The amount of time that the scope of leased IP addresses are valid until they expire. The value can be hours, days, weeks, months, etc.</td>

|                                                                        | 9: 26 or 54 Mbps  
|                                                                        | 10: 39 or 81 Mbps  
|                                                                        | 11: 52 or 108 Mbps  
|                                                                        | 12: 78 or 162 Mbps  
|                                                                        | 13: 104 or 216 Mbps  
|                                                                        | 14: 117 or 243 Mbps  
|                                                                        | 15: 130 or 270 Mbps |
| CTS Protection Mode                                                     | **CTS (Clear-To-Send) Protection Mode** boosts the device’s ability to catch all wireless transmissions, but can severely decrease performance. Select Auto if you want the device to use this feature as needed, when the Wireless- N/G products are not able to transmit to the device in an environment with heavy 802.11b traffic. Select Disable if you want to permanently disable this feature. |
| Beacon Interval.                                                        | The **Beacon Interval** value indicates the frequency interval of the beacon. A beacon is a packet broadcast by the device to synchronize the wireless network.  
|                                                                        | (Default: 100 msec, Range: 20-1000) |
| DTIM Interval.                                                          | The **Delivery Traffic Indication Message (DTIM)** indicates the interval between Broadcasts/Multi-cast transmissions. DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the device has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. Its clients hear the beacons and awaken to receive the broadcast and multicast messages.  
|                                                                        | (Default: 1, Range: 1-255) |
### Configure Wireless Settings

Follow the steps below to set up the following advanced wireless functions:

1. From the **Wireless** menu in the toolbar, click the **Advanced Settings** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fragmentation Threshold</td>
<td><strong>Fragmentation Threshold.</strong> Specifies the maximum size for a packet before data is fragmented into multiple packets. If you experience a high packet error rate, you may slightly increase the Fragmentation Threshold. Setting the Fragmentation Threshold too low may result in poor network performance. Only minor reduction of the default value is recommended. In most cases, it should remain at its default value of 2346.</td>
</tr>
<tr>
<td>RTS Threshold</td>
<td><strong>RTS Threshold.</strong> Determines at what packet size beyond which the ready to send/clear to send (RTS/CTS) mechanism is invoked. If you encounter inconsistent data flow, only minor reduction of the default value, 2346, is recommended. If a network packet is smaller than the preset RTS Threshold size, the RTS/CTS mechanism will not be enabled. The device sends Ready to Send (RTS) frames to a particular receiving station and negotiates the sending of a data frame. After receiving a RTS, the wireless station responds with a Clear to Send (CTS) frame to acknowledge the right to begin transmission. The RTS Threshold value should remain at its default value of 2347.</td>
</tr>
</tbody>
</table>
Configure WDS Settings

The Wireless Distribution System (WDS) Settings page allows you to expand the coverage of your wireless network by deploying signal repeaters.

Figure 15. WDS Settings screen

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Wi-Fi Radio 1 WDS Settings | **WDS MAC Address.** Displays the WDS MAC Address (or BSSID) of your gateway access point.  
**Allow Wireless Signal To Be Repeated by a Repeater.** Select this option to allow a wireless client to connect to a repeater and route traffic between the wireless client and a repeater. A maximum of three (3) repeaters is allowed.  
**Remote Access Point’s MAC Address (MAC 1 through 3).** Use the three fields (MAC 1, 2, and 3) to enter the MAC address of the repeaters. |
| Wi-Fi Radio 1 WDS Settings | **WDS MAC Address.** Displays the WDS MAC Address (or BSSID) of your gateway access point.  
**Allow Wireless Signal To Be Repeated by a Repeater.** Select this option to allow a wireless client to connect to a repeater and route traffic between the wireless client and a repeater. A maximum of three (3) repeaters is allowed.  
**Remote Access Point’s MAC Address (MAC 1 through 3).** Use the three fields (MAC 1, 2, and 3) to enter the MAC address of the repeaters. |
Follow these instructions to configure WDS Settings.

**Important**: Make sure the channel settings are the same for all WDS enabled devices.

1. From the Wireless menu in the toolbar, click the WDS Settings tab.
2. Use the information in the Field Description column in the table above to help you populate the fields.
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure QoS Settings

Quality of Service (QoS) ensures better service to high-priority types of network traffic, which may involve demanding, real-time applications, such as video conferencing. QoS settings allow you to specify priorities for different types of traffic. Lower priority traffic will be slowed down to allow greater throughput or less delay for high priority traffic.

Figure 16. QoS screen

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Wi-Fi Radio 1 QoS and Wi-Fi Radio 2 QoS | **WMM Support.** If WMM (Wi-Fi Multimedia) is supported by your wireless clients, enabling this feature means that voice and multimedia traffic will be given higher priority than other traffic. Select the desired option:  
  - **Enable** (factory default)  
  - **Disable**  

**No ACK.** Abbreviation for Acknowledgement (data networks). It is a signal to acknowledge the receipt of data. No Ack allows you to enable or disable No ACK. No ACK is disabled by default. This feature is recommended for data services where speed of transmission is important and packet loss is tolerable to a certain degree. If you select **Disable**, an acknowledge packet is returned for every packet received. This provides a more reliable transmission, but it increases traffic load, which decreases performance. Select the desired option:  
  - **Enable** |
Follow these instructions to configure QoS priorities for different types of traffic:

1. From the Wireless menu in the toolbar, click the QoS tab.
2. Use the information in the Field Description column in the table above to help you populate the fields.
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure Security{ XE "Configure Security" \t "See" }

This section provides procedures on how to establish security for your gateway; such as how to set the level of protection for the firewall, how to enable or disable a virtual private network (VPN) pass-through, and how to configure the VPN tunnel.

Configure Firewall Settings{ XE "Configure Firewall Settings" \t "See" }

Use the settings on this page to configure a firewall and filter types of unwanted traffic on the gateway local network. Advanced firewall technology deters hackers and protects your network from unauthorized access.

Figure 17. Firewall Settings screen
### Section | Field Description
--- | ---
Firewall | **SPI Firewall Protection.** Stateful firewall (which is any firewall that performs stateful packet inspection (SPI) or stateful inspection) is a firewall that tracks the state of network connections; e.g., TCP streams, UDP communication that travel across it. The firewall is programmed to distinguish legitimate packets for different types of connections. Only packets that match a known active connection are allowed by the firewall; others are rejected.

Select the desired option:
- **Off** (factory default). No ports are restricted and SPI is “off.”
- **Low**. No ports are restricted and SPI is “on.”
- **Medium**. The following ports are allowed and SPI is “on”:
  - 5190, 546, 547, 53, 989, 990, 80, 8080, 443, 143, 993, 4500, 123, 110, 995, 1812, 25, 22, 465, 1725, 1200, 992, 3074, 3724, 5050
- **High**. The following ports are allowed and SPI is “on”:
  - 53, 80, 443, 993, 4500, 123, 995, 22, 25, 465

Cox Business VoiceManager Toolbar or Receptionist Console application users must set the gateway firewall to “Low” to achieve full functionality.

**IPv6 Firewall Protection.**
- **Off**
- **On** (factory default)

Filter | Block fragmented IP packets. Enables/disables filtering of fragmented IP packets. This feature helps protect your private local network from Internet based denial of service attacks.
**Block Port Scan Detection.** Enables/disables the gateway from responding to Internet based port scans. This feature is designed to protect your private local network from Internet based hackers who attempt to gain unsolicited access your network by detecting open IP ports.
**Block IP Flood Detection.** Blocks malicious devices that attempt to flood devices or networks with illegal broadcast packets. Also referred to as “broadcast storm.”

*Note:* This is the factory default option.

Block WAN Requests | **Block Anonymous Internet Requests.** Enable this feature to keep your network from being “pinged” or detected by other Internet users. It also hides your network ports. Both make it more difficult for outside users to enter your network.

*Note:* This is the factory default option.
Follow these instructions to configure Firewall settings:

1. From the Security menu in the toolbar, click the Firewall tab.
2. Use the information in the Field Description column in the table above to help you populate the fields.
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
### Configure VPN Pass-through Settings

Use this page to configure Virtual Private Network (VPN) support. Enabling the settings on this page allows VPN tunnels using IPsec or PPTP protocols to pass through the gateway’s firewall.

**Figure 18. VPN Pass-through screen**

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| VPN Passthrough  | **IPSec Pass-through.** Enables/disables Internet Protocol Security (IPsec). IPsec is a suite of protocols used to implement secure exchange of packets at the IP layer. If you enable IPSec Pass-through, applications that use IPsec (IP Security) can pass through the firewall. Select Disable to deactivate IPSec Pass-through. Select the desired option:  
  - Enable (factory default)  
  - Disable  

**PPTP Pass-through.** Enables/disables Point-to-Point Tunneling Protocol (PPTP). PPTP allows the Point-to-Point Protocol (PPP) to be tunneled through an IP network. If you enable PPTP pass-through, applications that use Point to Point Tunneling Protocol (PPTP) can pass through the firewall. Select Disable to deactivate PPTP Pass-through. Select the desired option:  
  - Enable (factory default)  
  - Disable |

Follow these instructions to configure VPN Pass-through settings:

1. From the Security menu in the toolbar, click the VPN Passthrough tab.
2. Use the information in the Field Description column in the table above to help you populate the fields.
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure VPN Settings

A Virtual Private Network (VPN) is a connection between two endpoints in different networks that allows private data to be sent securely over public networks or other private networks. This is accomplished by creating a “VPN tunnel.” The Cisco gateway can deploy at two customer locations so that a VPN tunnel may be configured and connected between the two locations. This allows clients on either side to access resources in the other site as though they are part of the same LAN.

The configuration of this feature and the tunnel is customer-specific and is the responsibility of the customer administrator.

Figure 19. VPN screen
<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| VPN Tunnel            | **Select Tunnel Entry.** Allows you to display a list of created VPN tunnels.  
**Create.** Click to generate a new tunnel entry.  
**Delete.** Click to remove all settings for the selected tunnel  
**Summary.** Click to display the settings and status of all enabled tunnels.  
**IPSec VPN Tunnel.** Allows you to enable or disable Internet Security Protocol for the VPN tunnel.  
**Tunnel Name.** Enter the name for this tunnel. |
| Local Secure Group    | Select the local LAN user(s) that can use this VPN tunnel. This may be a single IP address or sub-network. The Local Secure Group must match the remote gateway’s Remote Secure Group.  
**IP.** Enter the IP address of the local network.  
**Mask.** If the Subnet option is selected, enter the mask to determine the IP address on the local network. |
| Remote Secure Group   | Select the remote LAN user(s) behind the remote gateway who can use this VPN tunnel. This may be a single IP address, a sub-network, or any addresses.  
If “Any” is set, the gateway acts as responder and accepts requests from any remote user. The Remote Secure Group must match the remote gateway’s Local Secure Group.  
**IP.** Enter the IP address of the remote network **Mask.** If the Subnet option is selected, enter the mask to determine the IP addresses on the remote network. |
| Remote Secure Gateway | Select the desired option, IP Addr., Any, or FQDN. If the gateway has a dynamic IP address, select Any or FQDN. If Any is selected, the gateway will accept requests from any IP address.  
**FQDN.** If FQDN is selected, enter the domain name of the remote gateway so the gateway can locate a current IP address using DDNS.  
**IP.** The IP address in this field must match the public (WAN or Internet) IP address of the remote gateway at the other end of this tunnel. |

<tbody>
<tr>
<td>Buttons</td>
<td><strong>Connect.</strong> Click to establish a connection for the current VPN tunnel. If you have made any changes, click <strong>Save Settings</strong> to first apply your changes.</td>
</tr>
<tr>
<td></td>
<td><strong>Disconnect.</strong> Click to break a connection for the current VPN tunnel.</td>
</tr>
<tr>
<td></td>
<td><strong>View Log.</strong> Click to view the VPN log, which shows details of each established tunnel.</td>
</tr>
<tr>
<td></td>
<td><strong>Advanced Settings.</strong> If the Key Exchange Method is Auto (IKE), this button provides access to additional settings relating to IKE. Click this button if the gateway is unable to establish a VPN tunnel to the remote gateway, and make sure the Advanced Settings match those on the remote gateway.</td>
</tr>
<tr>
<td></td>
<td><strong>Phase 1 - Operation Mode.</strong> Select the method appropriate for the remote VPN endpoint.</td>
</tr>
<tr>
<td></td>
<td><strong>Main:</strong> Main mode is slower but more secure.</td>
</tr>
<tr>
<td></td>
<td><strong>Aggressive:</strong> Aggressive mode is faster but less secure.</td>
</tr>
<tr>
<td></td>
<td><strong>Local Identity.</strong> Select the desired option to match the Remote Identity setting at the other end of this tunnel.</td>
</tr>
<tr>
<td></td>
<td><strong>Local IP Address:</strong> Your WAN (Internet) IP address.</td>
</tr>
<tr>
<td></td>
<td><strong>Name:</strong> Your domain name.</td>
</tr>
<tr>
<td></td>
<td><strong>Remote Identity.</strong> Select the desired option to match the Local Identity setting at the other end of this tunnel.</td>
</tr>
<tr>
<td></td>
<td><strong>Local IP Address:</strong> WAN (Internet) IP address of the remote VPN endpoint.</td>
</tr>
<tr>
<td></td>
<td><strong>Name:</strong> Domain name of the remote VPN endpoint.</td>
</tr>
<tr>
<td></td>
<td><strong>Encryption.</strong> This is the encryption algorithm used for the IKE SA. It must match the setting used at the other end of the tunnel.</td>
</tr>
</tbody>
</table>

Follow these instructions to configure VPN settings.

1. From the **Security** menu in the toolbar, click the **VPN** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.
Control Access to the Internet

This section provides procedures for configuring the options available on the Access Restriction page.

Configure IP Address Filtering Settings

Use the settings on this page to configure IP address filters. These filters prevent a range of IP addresses from accessing the Internet.

**Important:** If you are not familiar with the advanced settings described in this section, contact your IT department before you attempt to change any of the default advanced IP filtering settings.

Follow these instructions to configure IP Address Filtering settings.

1. From the Access Restrictions menu in the toolbar, click the IP Address Filtering tab.
2. In the Start Address and End Address fields, enter the range of IP addresses that you want to prevent from having access to your network. **(Note:** Check the Enable box to allow access of the range of addresses you defined.)
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure MAC Address Filtering Settings

Use the settings on this page to configure MAC address filters. These filters permit you to allow or block a range of MAC addresses from accessing the Internet based on MAC address.

**Important:** If you are not familiar with the advanced settings described in this section, contact your IT department before you attempt to change any of the gateway default advanced MAC address filtering settings.

![MAC Address Filtering screen](image)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Restriction</td>
<td><strong>Block devices listed below from accessing the Internet.</strong> Select to deny Internet access to the MAC addresses listed in the MAC Address Filter List fields. All other MAC addresses will be allowed Internet access. <strong>Permit devices listed below to access the Internet.</strong> Select to allow Internet access only to the MAC addresses of the devices you list in the MAC Address Filter fields. Any MAC addresses not listed in the table will be denied Internet access.</td>
</tr>
<tr>
<td>MAC Address Filter List</td>
<td>In the available fields, enter the MAC addresses of the devices whose Internet access you want to control.</td>
</tr>
</tbody>
</table>
Follow these instructions to configure **MAC Address Filtering** settings:

1. From the **Access Restrictions** menu in the toolbar, click the **MAC Address Filtering** tab.
2. Select the **Enable** or **Disable** radio button to turn on a filter for MAC IP addresses.
3. Select the **Block devices...** or **Permit devices...** radio button to prevent or allow the MAC IP address(es) that you define. (**Note**: You can enter a maximum of 20 addresses.)
4. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.
Configure Applications \{ XE "Configure Applications" \See \} 

This section provides procedures for configuring the options on the Applications page.

**Important:** Most well-known Internet applications are supported by Application Layer Gateways (ALGs). ALGs automatically adjust the gateway firewall to allow data to pass without making any custom settings. We recommend that you test your application before making changes in this section.

**Configure Port Filtering Settings\{ XE "Configure Port Filtering Settings" \See \}**

Use the settings in this window to configure transmission control protocol (TCP) and user datagram protocol (UDP) port filters. These filters prevent a range of TCP/UDP ports from accessing the Internet. You can also prevent PCs from sending outgoing TCP/UDP traffic to the WAN on specific IP port numbers. This filter is not IP address- or MAC address- specific. The system blocks the specified port ranges for all PCs.

*Figure 22. Port Filtering screen*
<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Port Filtering   | **Start Port.** Enter the starting port number in the range (external ports) used by the server or Internet application. Check with the software documentation of the Internet application for more information if necessary.  
**End Port.** Enter the final port number in the range (external ports) used by the server or Internet application.  
**Protocol.** Select one of the following protocols:  
  - TCP  
  - UDP  
  - Both  
**Enable.** Allows you to activate port filtering. |

Follow these instructions to configure the port filtering for application features:

1. From the **Application Layer Gateway** menu in the toolbar, click the **Port Filtering** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.
Configure Port Range Forwarding Settings{ XE "Configure Port Range Forwarding Settings" \t "See" }

Port Range Forwarding Settings allow you to configure ports that are to be used for public services on your network, such as security cameras, web servers, FTP servers, email servers or other specialized Internet applications.

Important:

- The gateway normally implements a feature called Port Translation. Port Translation monitors those ports that are used by your PCs or other devices on your LAN. This monitoring provides an added level of security beyond what the firewall provides. However, there are some applications that require the gateway to use specific ports to connect over the Internet.

- Port Range Forwarding continually exposes the selected ports to the public Internet. This means that the firewall is not active on these ports. The device with the forwarding IP address can be exposed to hacker attacks while the port range is being forwarded.

Figure 23. Port Range Forwarding screen
<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Port Range Forwarding    | **External Start.** Select the first port number from the recommended 49152 - 65535 range. Keep in mind that ports being used are program-specific so check which ones the program requires to be forwarded.  
**External End.** Select the last port number from the recommended 49152 - 65535 range. Keep in mind that ports being used are program-specific so check which ones the program requires to be forwarded.  
**Internal IP Address.** Enter the computer’s IP address to which this is to apply.  
**Internal Start Port.** Enter the beginning of the range of port numbers (internal ports) used by the server or Internet application.  
**Internal End Port.** Enter the end of the range of port numbers (internal ports) used by the server or Internet application.  
**Protocol.** Select one of the following network protocols:  
  - TCP  
  - UDP  
  - Both  
**Enable.** Check this box to activate port forwarding for the specified ports and IP addresses. |

Follow these instructions to configure the port range forwarding for application features:

1. From the Application Layer Gateway menu in the toolbar, click the Port Range Forwarding tab.
2. Use the information in the Field Description column in the table above to help you populate the fields.
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure Port Range Triggering Settings

Port Range Triggering is a way to automatically forward ports to a LAN PC that needs them at a specific time. A software application performs an event that triggers the router. The event must have an outbound access of a particular port range.

Figure 24. Port Range Triggering screen

<table>
<thead>
<tr>
<th>Section</th>

</tr>
</thead>
<tbody>
<tr>
<td>Port Range Triggering</td>
<td></td>
</tr>
<tr>
<td>Triggered Range</td>
<td></td>
</tr>
<tr>
<td>Start Port</td>
<td>Enter a beginning port number from the recommended 49152 - 65535 range. Remember that ports being used are program-specific so check which ones the program requires to be forwarded.</td>
</tr>
<tr>
<td>End Port</td>
<td>Enter an ending port number from the recommended 49152 - 65535 range. Remember that ports being used are program-specific so check which ones the program requires to be forwarded.</td>
</tr>
</tbody>
</table>
Configure Applications

| Forwarded Range | **Start Port.** For the Start port, select a value from the recommended 49152 - 65535 range. Remember that ports being used are program-specific so check which ones the program requires to be forwarded.  
**End Port.** For the End port, select a value from the recommended 49152 - 65535 range. Remember that ports being used are program-specific so check which ones the program requires to be forwarded.  
**Protocol.** Select one of the following protocols:  
- TCP  
- UDP  
- Both  
**Enable.** Click the Enable checkbox to enable port range triggering for the relevant application.

| Field Description | Follow these instructions to configure the port triggering for application features:  
1. From the Application Layer Gateway menu in the toolbar, click the Port Range Triggering tab.  
2. Use the information in the Field Description column in the table above to help you populate the fields.  
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Configure DMZ Settings

Use this page to configure a Demilitarized Zone (DMZ) host, commonly referred to as an “exposed host.” It is typically used by a company that wants to host its own Internet server. DMZ allows one IP address to be placed on the Internet side of the gateway firewall while others remain protected behind the firewall.

The DMZ allows a device to be directly accessible to Internet traffic, such as a web (HTTP) server, an FTP server, an SMTP (e-mail) server, and a domain name system (DNS) server.

Figure 25. DMZ screen

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMZ</td>
<td><strong>DMZ Hosting.</strong> Select the Enable radio to activate DMZ hosting. Select Disable (factory default) to deactivate DMZ hosting. <strong>DMZ Host IP Address.</strong> Enter the IP address of the computer you want to expose to the Internet.</td>
</tr>
</tbody>
</table>

Follow these instructions to configure the DMZ for Application features:

1. From the Application Layer Gateway menu in the toolbar, click the DMZ tab.
2. Use the information in the Field Description column in the table above to help you populate the fields.
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
Administration Settings

This section provides procedures on how to configure gateway settings, set up report email alerts, back up and restore configuration files, and how to reboot the device.

Configure Management Settings

Use the settings on the Administration Management page to allow the administrator to manage specific functions for access and security.

Figure 26. Administration Management screen
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Internet Connection Type      | **Working Mode.** Select one of the following options:  
**Router Mode.** Select this mode to have the gateway configured as a bridged device. This will disable all router/NAT features in the device and require all connected Administration Devices to receive a public IP address from Cox Business.  
**Bridged Only.** Select this mode to have the gateway configured as a bridged device. This will disable all router/NAT features in the device and require all connected devices to receive a public IP address from Cox Business.  
**Connection Mode.** Select one of the following options:  
**DHCP** (factory default) - Allows the gateway to obtain a public IP address automatically  
**Static IP** - Allows you to specify the WAN IP address and corresponding server information as static or fixed values that will be used when the gateway is online.  
**MTU size.** MTU is the Maximum Transmission Unit. The MTU size specifies the largest packet size permitted for Internet transmission.. The factory default = 0 (1500 bytes) |
| Gateway Access Local Access   | **Current User Name.** Identifies the user currently logged in to the device.  
**Change Current User Name to.** This field allows you to change your user name. If you want to change your user name, enter your new user name in this field and click **Save Settings** to apply the change. **Note:** The factory default user name is a blank field.  
**Change Password to.** This field allows you to change your password. If you want to change your password, enter your new password in this field. Then, re-enter your new password in the Re-Enter New Password field and click **Save Settings** to apply the change. **Note:** The factory default password is a blank field.  
**Re-Enter New Password.** Allows you to re-enter the new password. You must enter the same password as the one entered in the previous field Change Password to. After you re-enter your new password, click **Save Settings** to apply the change. |
Configure Administration Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Access</td>
<td><strong>Remote Management.</strong> Allows you to enable to disable remote management. This feature allows you to access and manage your gateway settings from the Internet when you are away from your business. To allow remote access, select <strong>Enable</strong>. Otherwise, keep the default setting, as <strong>Disable</strong>. The protocol HTTP is required for remote management. To remotely access the device, enter <a href="https://xxx.xxx.xxx.xxx:8080">https://xxx.xxx.xxx.xxx:8080</a> (the x’s represent the device’s public Internet IP address, and 8080 represents the specified port) in your web browser’s <strong>Address</strong> field. <strong>Management Port.</strong> Enter the port number that will be open to outside access. The factory default setting is 8080. This port must be used when you establish a remote connection.</td>
</tr>
<tr>
<td>UpnP</td>
<td><strong>UPnP.</strong> Universal Plug and Play (UPnP) allows Windows XP and Vista to automatically configure the gateway for various Internet applications, such as videoconferencing. If you want to use UPnP, keep the default, <strong>Enable</strong>. Otherwise, select <strong>Disable</strong>.</td>
</tr>
<tr>
<td>IGMP</td>
<td><strong>IGMP Proxy.</strong> Internet Group Multicast Protocol (IGMP) is used to establish membership in a multicast group and is commonly used for multicast streaming applications. For example, you may have Internet Protocol Television (IPTV) with multiple set-top boxes on the same local network. These set-top boxes have different video streams running simultaneously, so you should use the IGMP feature of the Router. IGMP forwarding (proxying) is a system that improves multicasting for LAN-side clients. If the clients support this option, keep the default, <strong>Enabled</strong>. Otherwise, select <strong>Disabled</strong>.</td>
</tr>
</tbody>
</table>

Follow these instructions to configure **Administration Management**:

1. From the **Administration** menu in the toolbar, click the **Management** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.
Configure Reporting Settings

Use the settings in the Reporting tab to establish whether or not you want and email alert sent to you if a Denial of Service is identified. If you select the **Enable** option, you will need to populate the corresponding fields.

The table below instructs you on how to enter values in each field.

**Figure 27. Reporting screen**

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reporting</td>
<td><strong>E-Mail Alerts.</strong> If enabled, an email will be sent immediately if a Denial of Service (DoS) attack is detected. To use this feature, provide the necessary email address information.</td>
</tr>
<tr>
<td></td>
<td><strong>SMTP Mail Server.</strong> Enter the address (domain name) or IP address of the Simple Mail Transport Protocol (SMTP) server you use for outgoing email.</td>
</tr>
<tr>
<td></td>
<td><strong>E-Mail Address for Alert Logs.</strong> Enter the email address that should receive the logs.</td>
</tr>
<tr>
<td></td>
<td><strong>SMTP Username.</strong> Enter the username for the SMTP server.</td>
</tr>
<tr>
<td></td>
<td><strong>SMTP Password.</strong> Enter the password for the SMTP server.</td>
</tr>
<tr>
<td></td>
<td><strong>View Log.</strong> Click to display log data.</td>
</tr>
</tbody>
</table>

Follow these instructions to configure Reporting settings:

1. From the Administration menu option, click the **Reporting** tab.
2. Use the information in the table shown above to explain the settings and modify them as required. When you complete your edits, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to prevent the changes from being saved.
Configure Back Up and Restore Settings

Use the settings on this page to back up the configuration and store it in a file on your computer. You can also use this page to reestablish a previously saved configuration file.

Figure 28. Backup and Restore screen

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Back Up Configuration</td>
<td>Use this feature to download a copy of the current configuration, and store the file on your computer. Click the <strong>Backup</strong> button to start the download.</td>
</tr>
<tr>
<td>Restore Configuration</td>
<td>Use this feature to restore a previously saved configuration file. Click the <strong>Browse</strong> button to select the configuration file, and then click the <strong>Restore</strong> button to upload the configuration file to the device.</td>
</tr>
</tbody>
</table>

**WARNING!** Uploading a configuration file will destroy (overwrite) ALL of the existing settings.

Follow these instructions to download a configuration file to your computer that the device currently uses.

1. From the **Administration** menu in the toolbar, click the **Back Up & Restore** tab.
2. Use the information in the **Field Description** column in the table above to help you back up and restore configuration files.
**Caution:** Restoring a configuration file will overwrite all of the existing settings in the gateway, using the previously saved configuration file on your computer. It will not restore the administrative user name or administrative user password.

1. Click the **Browse** button to locate the configuration file that you want to restore.
2. Click the **Restore** button to upload the configuration file to the gateway. The gateway overwrites the current configuration file with the file you have selected so that the device operates with the configuration settings stored in that file.

**Cox Business MyAccount Backup and Restore**

Cox Business MyAccount provides another way you can configure a gateway and upload or download a file to your computer. See Figures 33-36.

**Figure 29.** **MyAccount Access** [https://myaccount.coxbusiness.com/](https://myaccount.coxbusiness.com/)

Record the password authentication method configured in your router to prevent unauthorized users from accessing your network.

WEP: Wireless security protocol designed to provide the same level of protection as a wired network.

WPA: Provides a more enhanced level of network security over WEP.

WPA2: Offers the strongest data protection and network access control for unauthorized users. A minimum 13-character network password required.
Configure Administration Settings

Use the following steps to securely save your gateway settings MyAccount.

1. Log into **MyAccount** and select the **Data Tools** menu option in the left navigation bar.

2. Click the Internet Gateway link.
   - **Result**: The Internet Gateway Settings window displays.

3. From the **Select Gateway/Guest Wi-Fi** drop-down menu, click the device to which you want to configure settings.
   - **Result**: The **Internet Gateway Settings** window appears.

4. Populate the fields appropriately. You can also click the **question mark icons** for helpful information about the field.

5. Click the **Save** button.

**MyAccount Configuration File Upload and Download**

**Figure 32.** **Upload / Download Configuration File**

Use the following steps to upload a new configuration file to MyAccount or download/delete an existing stored configuration file to your computer.

1. Click the **Upload** button to browse and locate the configuration file you want to upload from your PC to MyAccount and click the **Open** button.
   - **Result**: The file is uploaded to MyAccount.

   **Note**: You can upload and store a maximum of three files with a size limit of 50KB per file. If you have three stored files, you must delete an existing file before you can upload another.

2. To download a **Stored Configuration File**, click the **Download To PC** link to the right of the file you want to use. (Click the **Delete** link to remove it from your computer.)
   - **Result**: The **File Download** dialog box appears.

3. Click the **Open** or **Save** button based on whether you want to view the file or save it to your computer.

4. If you click the **Save** button and save the configuration file to an easy to remember location on your PC.

5. Log back into the gateway interface and use the **Restore** function add the configuration file to your router.
**Restart the Device**

The Device Restart tab allows you to reboot the Gateway.

**Important**: This is only a reboot; configuration settings will not be lost or altered.

**Figure 33. Restart screen**

</tbody>
</table>

Follow these instructions to reboot the gateway.

1. From the Administration menu in the toolbar, click the Device Restart tab.
2. Enter the Password associated with the User Name.
3. Click the Device Restart button.
Monitor Device Status

This section provides current detailed information about the gateway, local network, and wireless connection. Some of the data shown includes:

- Firmware version
- Internet IPv4 connection
- Local network
- MAC address / IP address
- Subnet mask
- DHCP Server and IP range
- Default gateway
- Wi-Fi Radio 1 Network
- Wi-Fi Radio 2 Network

Note: The on-screen information will vary depending on the Internet Connection Type you use.

Gateway Status

This screen provides details about the gateway and Internet IPv4 connection.

Figure 34. Gateway Information screen
<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Gateway Information    | **Firmware Version.** The version number of the firmware. It is a unique alphanumeric address for the cable modem coaxial interface, which is used to connect to the cable modern termination system (CMTS) at the headend. A media access control (MAC) address is a hardware address that uniquely identifies each node of a network.  
**Current Time.** The time, based on the time zone selected on the Basic Setup page.  
**Router Mode.** The Internet Protocol version in use by the gateway.  
**IP Address.** The IP address of the WAN interface. This address is assigned to the gateway when it goes online.  
**Subnet Mask.** The subnet mask for your WAN port. This address is automatically assigned to your WAN port by your ISP except when a static IP address is set up.  
**Default Gateway.** The IP address of the ISP’s default gateway.  
**DNS IPv4 1-3.** The DNS IP addresses currently used by the gateway. |
| Internet IPv4 Connection| The DNS IP addresses currently used by the gateway.                                                                                             |

Use these steps to view specifics about the gateway and its current settings.

1. From the **Status** menu in the toolbar, click the **Gateway** tab.
2. Use the information in the **Field Description** column in the table above for information about the data shown
3. Click the **Refresh** button to update the information displayed on the page.
Local Network Status

The Local Network tab provides information about the status of the local area network.

  **Channel Width.** The Channel Width setting as shown on the Wireless Radio Settings page for the Wi-Fi Radio 2 Network.  
  **Channel.** The Channel setting as shown on the Wireless Radio Settings page for the Wi-Fi Radio 2 Network.  
  **Extended Channel.** The Extended Channel setting as shown on the Wireless Radio Settings page for the Wi-Fi Radio 2 Network.  
  **Security.** The security method used by your wireless network.  
  **SSID Broadcast.** The status of the gateway's SSID Broadcast feature.  

Follow these steps to view information about the wireless network used for Radio 1 and Radio 2.

1. From the **Status** menu in the toolbar, click the **Wireless** tab.
2. Use the information in the **Field Description** column in the table above for information about the data shown.
3. Click the **Refresh** button to update the information displayed on the page.
Storage & Sharing

The Storage & Sharing section allows you to configure settings for the router’s USB ports, manage network storage, and control how the media server performs.

**USB Settings**

You can use the USB Settings page to manage your attached network storage for sharing audio files or video content files over your network. These settings control your advanced router's USB port(s). The built-in media server locates USB devices for usage.

*Note:* If you are not familiar with the information contained in this section, contact your information technology professional for additional assistance before you change any of these settings.

<table>
<thead>
<tr>
<th>Section</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic Settings</td>
<td>The <strong>Enable USB Devices Connected to the USB port</strong> setting allows you to control whether <strong>All</strong> attached USB devices are active, <strong>None</strong> of the attached devices are active, or only the <strong>Approved</strong> devices you select are active. If you have more than one device attached to your advanced router's USB port(s), you can define which devices are approved for use within the Available Devices section. This setting allows you to check that only the USB devices you connect and want are used within your network.</td>
</tr>
</tbody>
</table>
Use the following steps to configure basic USB settings.

1. From the **Storage & Sharing** menu in the toolbar, click the **USB Settings** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. Click the **Refresh List** button to update the settings.
Network Attached Storage (NAS)

Use the Network Attached Storage (NAS) page to manage specific settings including defining a global name for all your storage that will be seen within your network, as well as if the device will be part of a larger group of your network's resources. These settings are useful if you have a large number of network devices that you want to make easily available to other parts of your network.

**Note:** If you are not familiar with the information detailed in this section, contact your information technology professional for additional assistance before you change any of these settings.

Figure 38. **Network Attached Storage screen**

</tr>
</tbody>
</table>
Use the following steps to configure Network Attached Storage (NAS) basic and advanced settings.

1. From the Storage & Sharing menu in the toolbar, click the NAS tab.
2. Use the information in the Field Description column in the table above to help you populate the fields.
3. After you make your selections, click the Save Settings button to apply your changes or click the Cancel Changes button to withdraw.
**Media Server**

Your advanced router has a built-in media server that can be used for sharing audio, video, pictures, and related content from attached USB storage devices with other devices connected to your network. Use this configuration page to control how the media server operates.

*Note:* If you are not familiar with the information detailed in this section, contact your service provider for additional assistance before you change any of these settings.

![Media Server screen](image)
### Media Server Basic Settings

This section shows the basic status of your advanced router’s DLNA media server including whether or not it is enabled, the status of any files being located, and the default name that will be seen by and used by other DLNA-capable devices within your network.

Use the **Enable** and **Disable** option to control the status of your advanced router’s media server.

The **Media Server Name** option allows you to define a custom name that will be advertised to and located by any other DLNA-capable devices you use within your network for sharing files.

Click the **Apply Settings** button to save your changes.

### Media Server Scan Settings

This section allows you to control how your advanced router’s DLNA media server locates audio, video, pictures, and other files to make them available for sharing within your network.

You can choose to discover all supported media files from the list below or individually select specific file types for sharing.

If you choose to **Scan All Files**, all supported file types available will be discovered by the media server from your attached network storage. Alternatively, you can choose to **Scan By File Type**. This allows you to select specific audio, video, image, and/or related content types you want to have discovered and shared by your media server.

When the **Scan By File Type** option is used, select the specific audio, video, image, or other supported content types from each shown column you want to be discovered and shared by your media server.

Click the **Selected** button for each category to choose only those types to be discovered and made available for sharing.

Check the **Schedule Scanning** box and enter a desired time in minutes. This allows you to control how frequently your advanced router’s media server scans for new content to share from your attached network storage devices.

Click the **Apply Scan Settings** button to save any specific settings for future use.

Click the **Scan Now** button to immediately have your media server scan for new file types for sharing from your attached USB network storage device(s).

---

Use the following steps to activate, deactivate, and configure the media server.

1. From the **Storage & Sharing** menu in the toolbar, click the **Media Server** tab.
2. Use the information in the **Field Description** column in the table above to help you populate the fields.
3. After you make your selections, click the **Save Settings** button to apply your changes or click the **Cancel Changes** button to withdraw.
Advanced Gateway Configurations

The Cisco 3829AD gateway is capable of supporting VLANs (Virtual Local Area Networks) configured to any of the 4 wired interfaces or wireless SSIDs. The gateway is also capable of supporting bridged mode for the entire gateway or individual wired interfaces (referred to as Mixed Mode). The VLAN, Bridge Mode and Mixed Modes can only be enabled by Cox Communications; these are not advised for majority of business use cases where these configurations are needed will be extremely rare. If you required these configurations please contact Cox Business customer care. Cox can remotely enable these capabilities however it is the responsibility of the customer administrator to configure and manage the settings to meet their business needs. Cox will only enable the features.

Virtual Local Area Network

The Virtual Local Area Network (VLAN) feature set is used to logically group LAN side network interfaces to create a VLAN. Each VLAN creates a network broadcast domain and provides traffic isolation between other VLANs configured.

Customers have requested this type of LAN side port isolation for additional security (Ethernet/Wi-Fi) as well as the ability to forward or route traffic from specific ports back to Layer 3 routers and switches on the network side.

Note: In the current architecture, VLAN tags cannot be added or stripped for packets traversing the Wi-Fi interfaces due to performance concerns. However, if the Wi-Fi-connected CPE adds a VLAN tag, it can be prioritized into an upstream service flow. The current software implementation does not support VLAN double tagging (Q-in-Q tagging).

The current VLAN implementation only supports IPv4 subnets and addresses. The VLANs are interface-based. Each interface on the router can be assigned a unique VLAN ID—or multiple interfaces can be grouped and assigned to the same VLAN ID. However, a specific interface cannot be a member of more than one VLAN.

VLAN IDs in the range of 2 to 1005 are possible. By default, all interfaces are a member of the default VLAN ID = 1. Firewall and UpNP are configurable per VLAN via the GUI settings.
User Provisioning Details for VLAN Feature

When the VLAN feature is remotely enabled by Cox Customer Care team, the Web GUI control page (called VLAN) is available for the advanced user under the Setup tab.

The user can create a VLAN and select the interface they wish to be part of that VLAN. Each VLAN has its own IP subnet, along with the Firewall and UPnP controls.

Each VLAN

Figure 40. VLAN tab
**Bridge Mode**

The Bridge Mode—which operates at the Data Link Layer (level 2) and does not understand communications protocol other than the physical medium (MAC), typically an Ethernet—allows the gateway to run in that mode instead of a router mode.

NAT will be disabled and the gateway will operate exactly as a traditional DOCSIS 3.0. The Wi-Fi capability will be disabled. The Cox Business Customer Care team is the only entity that can enable this mode.

*Note:* Customers will rarely prefer this configuration

Figure 41. **Bridged Mode Gateway Setting**
**Mixed Mode**

Each of the 4 Gigabit Ethernet ports available is primarily used in conjunction with Radio 1’s primary SSID. In case of router or bridge modes, all of these ports will be set to modes with independent control over ports.

This feature provides the customer with the flexibility to control and configure individual Gigabit Ethernet ports in either the Bridge or Router mode independently. For example, a customer can have port 1 and port 2 in Bridge Mode while port 3 and port 4 is in Router Mode.

This is an extremely advanced configuration that the majority of customers will not require. If you believe Mixed Mode is necessary, or you have technical questions, contact the Cox Business Technical Support team at 1-877-935-7038.

*Note:* In case of a Mixed Mode setting, the primary Wi-Fi interface can only be in Router Mode.
Troubleshooting and Frequently Asked Questions

This section describes the most common issues that may occur after the gateway is installed and provides possible solutions and tips for improved performance of the gateway.

**The wireless gateway does not register an Ethernet connection**

Try one of the following solutions:

- Verify that your computer has an Ethernet card and that the Ethernet driver software is properly installed. If you purchase and install an Ethernet card, follow the installation instructions very carefully.
- Verify the status of the front panel status indicator lights.

**The wireless gateway does not register an Ethernet connection after connecting to a hub**

If you are connecting multiple PCs to the gateway, you should first connect the gateway to the uplink port of the hub using the correct crossover cable. The LINK LED of the hub will illuminate continuously.

**The wireless gateway does not register a cable connection**

The gateway works with a standard 75-ohm RF coaxial cable. If you are using a different cable, your gateway will not function properly. Contact your service provider to determine whether you are using the correct cable.
Frequently Asked Questions

This section provides answers to common questions about the gateway.

I don’t understand the front panel status indicators

Front Panel Description

The front panel of your gateway provides LED status indicators that indicate how well and at what state your gateway is operating.

**How do I configure the TCP/IP?**

To configure TCP/IP protocol, you need to have an Ethernet Network Interface Card (NIC) with TCP/IP communications protocol installed on your system. TCP/IP is a communications protocol used to access the Internet.

This section contains instructions for configuring TCP/IP on your Internet devices to operate with the gateway in Microsoft Windows or Macintosh environments.

TCP/IP protocol in a Microsoft Windows environment is different for each operating system. Follow the appropriate instructions in this section for your operating system.
Configure TCP/IP on Windows 7 Systems

1. Open Network Connections by clicking the Start button, and then clicking Control Panel.

2. In the Search box, type adapter, and then under Network and Sharing Center, click View network connections.

3. Right-click the connection that you want to change, and then click Properties. If you are prompted for an administrator password or confirmation, type the password or provide confirmation. The Local Area Connection Properties window displays.

4. Click the Networking tab.

5. Under This connection uses the following items, click either Internet Protocol Version 4 (TCP/IPv4) or Internet Protocol Version 6 (TCP/IPv6), and then click Properties.

6. To specify IPv4 IP address settings, do one of the following:
   - To get IP settings automatically using DHCP, click Obtain an IP address automatically, and then click OK.
   - To specify an IP address, click Use the following IP address and enter the IP address settings in the IP address, Subnet mask, and Default gateway fields.

7. To specify IPv6 IP address settings, do one of the following:
   - To get IP settings automatically using DHCP, click Obtain an IPv6 address automatically, and then click OK.
   - To specify an IP address, click Use the following IPv6 address and enter the IP address settings in the IPv6 address, Subnet prefix length, and the Default gateway fields.

8. To specify DNS server address settings, do one of the following:
   - To get a DNS server address automatically using DHCP, click Obtain DNS server address automatically, and then click OK.
   - To specify a DNS server address, click Use the following DNS server addresses, and enter the addresses of the primary and secondary DNS servers, in the Preferred DNS server and Alternate DNS server fields.

9. To change advanced DNS, WINS, and IP settings, click Advanced.

10. When you are finished, click OK.

11. Try to access the Internet. If you cannot access the Internet, contact your service provider for further assistance.
Configure TCP/IP on Windows XP Systems

1. Click **Start**, and depending on your Start menu setup, choose one of the following options:
   - If you are using the **Windows XP Default Start Menu**, select **Connect to**, choose **Show all connections**, and proceed to step 2.
   - If you are using the **Windows XP Classic Start Menu**, select **Settings**, choose **Network Connections**, click **Local Area Connection**, and proceed to step 3.

2. Double-click the **Local Area Connection** icon in the LAN or **High-Speed Internet** section of the **Network Connections** window.

3. Click **Properties** in the Local Area Connection Status window.

4. Click **Internet** Protocol (TCP/IP), and then click **Properties** in the Local Area Connection Properties window.

5. Select both Obtain an IP address automatically and Obtain DNS server address automatically in the Internet Protocol (TCP/IP) Properties window, and then click **OK**.

6. Click **Yes** to restart your computer when the **Local Network** window displays. The computer restarts. The TCP/IP protocol is now configured on your PC and your Ethernet devices are ready to use.

7. Try to access the Internet. If you cannot access the Internet, contact your service provider for further assistance.

Configure TCP/IP on Macintosh Systems

1. Click the **Apple** icon in the upper-left corner of the Finder. Scroll down to **Control Panels** and click **TCP/IP**.

2. Click **Edit** on the **Finder** at the top of the screen. Scroll down to the bottom of the menu and click **User Mode**.

3. Click **Advanced** in the **User Mode** window and click **OK**.

4. Click the **Up/Down** selector arrows located to the right of the **Connect Via** section of the **TCP/IP** window and click **Using DHCP Server**.

5. Click **Options** in the **TCP/IP** window and click **Active** in the **TCP/IP Options** window.

**Note:** Make sure that the **Load only when needed** option is **unchecked**.

6. Verify that the **Use 802.3** option located in the upper-right corner of the TCP/IP window is unchecked. If there is a check mark in the option, uncheck the option, and click **Info** in the lower-left corner.

7. Is there a Hardware Address listed in this window?
   - If **yes**, click **OK**. To close the TCP/IP Control Panel window, click **File**, and then scroll down to click **Close**. You have completed this procedure.
   - If **no**, you must power off your Macintosh.
8. With the power off, simultaneously press and hold down the Command (Apple), Option, P, and R keys on your keyboard. Keeping those keys pressed down, power on your Macintosh but do not release these keys until you hear the Apple chime at least three times, then release the keys and let the computer restart.

9. When your computer fully reboots, repeat steps 1 through 7 to verify that all TCP/IP settings are correct. If your computer continues to be without a Hardware Address, contact your authorized Apple dealer or Apple technical support center for further assistance.

How do I renew the IP address on my PC?

If your PC cannot access the Internet after the gateway is online, it is possible that your PC did not renew its IP address. Follow the appropriate instructions in this section for your operating system to renew the IP address on your PC.

Renew the IP Address on Windows 7 Systems

1. Click the Windows Start button.
2. Type cmd in the Search box. The cmd window displays.
3. Type ipconfig/renew and press Enter to renew the IP address of the computer.

Renew the IP Address on Windows XP Systems

1. Click Start, and then click Run. The Run window opens.
2. Type cmd in the Open field and click OK. A window with a command prompt displays.
3. Type ipconfig/release at the C:/ prompt and press Enter. The system releases the IP address.
4. Type ipconfig/renew at the C:/ prompt and press Enter. The system displays a new IP address.
5. Click the X in the upper-right corner of the window to close the Command Prompt window. You have completed this procedure.

Note: If you cannot access the Internet, contact your service provider for further assistance.

Renew the IP Address on Macintosh Systems

1. Close all open programs.
2. Open your Preferences folder.
3. Drag the TCP/IP Preferences file to the Trash.
4. Close all open windows and empty the Trash.
5. Restart your computer.
6. As your computer starts, simultaneously press and hold down the Command (Apple), Option, P, and R keys on your keyboard. Keeping those keys pressed down, power on your Macintosh, but do not release these keys until you hear the Apple chime at least three times. Release the keys and allow the computer to restart.
7. When your computer fully reboots, click the Apple icon in the upper-left corner of the Finder. Scroll down to Control Panels, and then click TCP/IP.

8. Click Edit on the Finder at the top of the screen. Scroll to the bottom of the menu and click User Mode.

9. Click Advanced in the User Mode window, and then click OK.

10. Click the Up/Down selector arrows located to the right of the Connect Via section of the TCP/IP window, and then click Using DHCP Server.

11. Click Options in the TCP/IP window, and then click Active in the TCP/IP Options window.

**Note:** In some cases, the Load only when needed option does not appear. If it appears, select the option. A check mark appears in the option.

12. Verify that the Use 802.3 option located in the upper-right corner of the TCP/IP window is not selected. If there is a check mark in the option, select the option to clear the check mark, and then click Info in the lower-left corner.

13. Is there a Hardware Address listed in this window?
   - If yes, click OK. To close the TCP/IP Control Panel window, click File, and then scroll down to click Close.
   - If no, repeat these instructions from step 6.

14. Reboot your computer.

**How do I arrange for installation?**

Call Cox Business Technical Support to inquire about professional installation. A professional installation ensures proper cable connection to the gateway and to your PC, and it ensures the proper configuration of all hardware and software settings.

**How does the wireless gateway connect to my computer?**

The gateway connects to the 10/100/1000BASE-T Ethernet port on your PC. To use the Ethernet interface, Ethernet cards available from your local PC or office supply retailer. For best performance over an Ethernet connection, your PC should be equipped with a Gigabit Ethernet card.
Tips for Improved Performance

If your gateway does not perform as expected, the following tips may help. If you need further assistance, contact Cox Business Technical Support at 1-877-935-7038.

- Verify that the plug to your gateway AC power is properly inserted into an electrical outlet.
- Verify that your gateway AC power cord is not plugged into an electrical outlet that is controlled by a wall switch. If a wall switch controls the electrical outlet, make sure the switch is in the ON position.
- Verify that the ONLINE LED status indicator on the front panel of your gateway is illuminated.
- Verify that your cable service is active and that it supports two-way service.
- Verify that all cables are properly connected, and that you are using the correct cables.
- If you are using the Ethernet connection, verify that your TCP/IP is properly installed and configured.
- Verify that you have called your service provider and given them the serial number and MAC address of your gateway.
- If you are using a cable signal splitter so that you can connect the gateway to other devices, remove the splitter and reconnect the cables so that the gateway is connected directly to the cable input. If the gateway now functions properly, the cable signal splitter may be defective and may need to be replaced.
- If you are connected to your PC with an Ethernet connection, your PC should be equipped with a Gigabit Ethernet card for best performance.
- If your gateway has a USB port and you are connected to that port, verify that you have followed the procedures in Install USB Drivers on Your PC (Optional).
Cox Business Remote Support

Cox Customer Support provides basic remote support for many of the common features available in the Cisco gateway and can remotely access your gateway when it is online. However, Cox does not support the more advanced features specific to your network. The table below lists in- and out-of-scope features that Cox supports.

The Basic list of features mostly pertains to WiFi enablement of the gateway and other common settings that the majority of customers will use. The Advanced lists of features pertain to specific customer network requirements that impact LAN integration and specific client applications. The advanced settings are much more unique to customers and would be too difficult for Cox to properly configure and test remotely with a customer.
